LEMBAR REVIEW

Email Revisi:

Revisi Reviewer A:

Reviewer A:

Is the paper technically sound?

No

Does the paper contribute to the body of knowledge?

Neutral

Is the subject matter presented in comprehensive manner?

Neutral

Are the references provided applicable and sufficient?

Yes

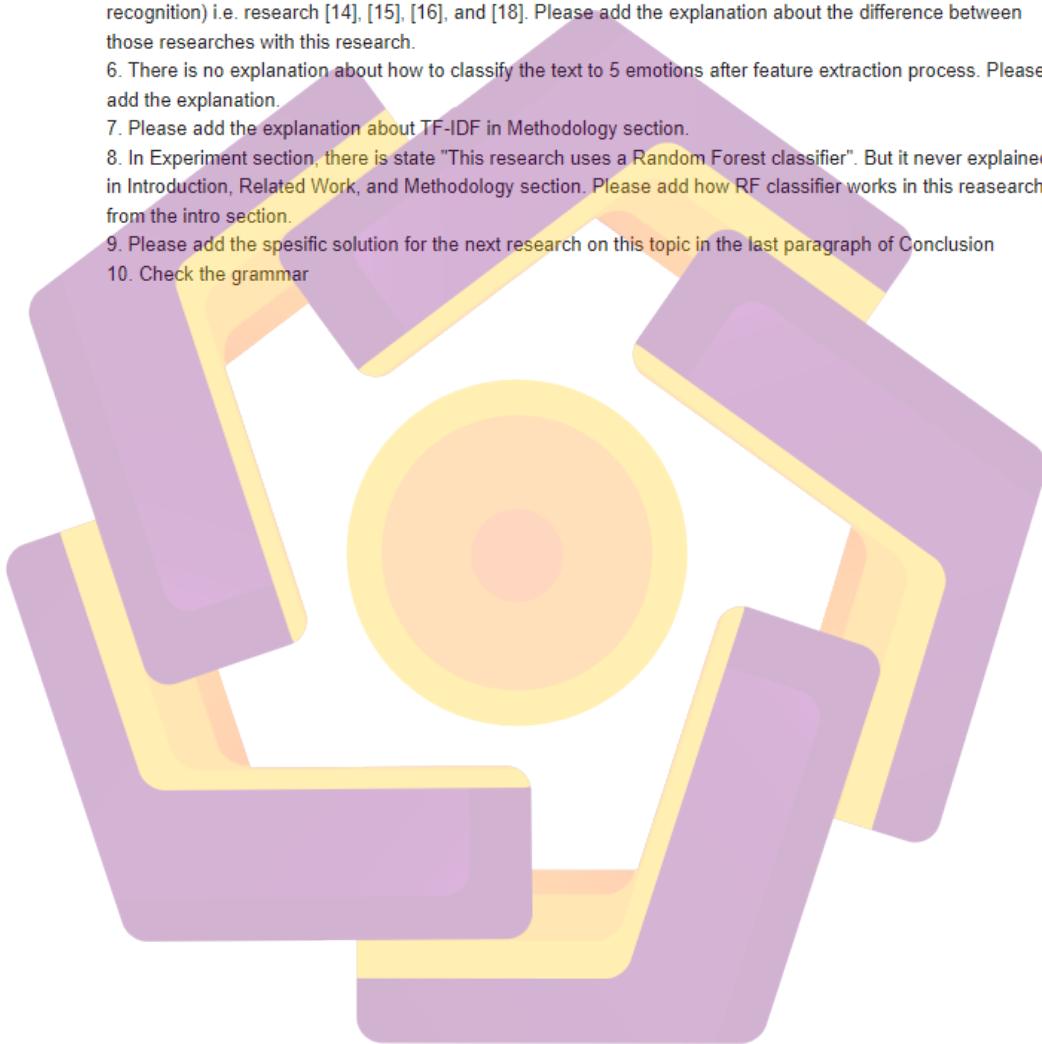

Are there references that are not appropriate for the topic being discussed?

No

If yes, then please indicate which reference should be removed.

Comments to the Author :

1. There is Natural Language Processing word in the Abstract, but it did not explained in Introduction. Please add the explanation about NLP that is related to this paper.
2. The 1st paragraph in Introduction is not related to the 2nd paragraph. Please add the explanation so that communication (1st paragraph) and sentiment analysis (2nd paragraph) are related.
3. In section Related Work, please add the explanation about the difference between this research and the previous researches.
4. The 2nd paragraph in Related Work has to be divided to two or three related paragraphs.
5. In the Related Work, there is some previous researches used the same method for the same topic (emotion recognition) i.e. research [14], [15], [16], and [18]. Please add the explanation about the difference between those researches with this research.
6. There is no explanation about how to classify the text to 5 emotions after feature extraction process. Please add the explanation.
7. Please add the explanation about TF-IDF in Methodology section.
8. In Experiment section, there is state "This research uses a Random Forest classifier". But it never explained in Introduction, Related Work, and Methodology section. Please add how RF classifier works in this research from the intro section.
9. Please add the specific solution for the next research on this topic in the last paragraph of Conclusion
10. Check the grammar

Abstract— Text Mining is a part of Neural Language Processing (NLP), also known as text analytics. Text mining includes sentiment analysis and emotion analysis which are often used to analyse social media, news, or other media in written form. The emotional breakdown is a level of sentiment analysis that categorises text into negative, neutral, and positive sentiments. Emotion is organised into several classes. This study categorized emotion into anger, fear, happiness, love, and sadness. This study proposed feature extraction using Lexicon and TF-IDF on the emotion recognition dataset of Indonesian texts. InSet Lexicon Dictionary is used as the corpus in performing the feature extraction. Therefore, InSet Lexicon was chosen as the dictionary to perform feature extraction in this study. The results show that InSet Lexicon has poor performance in feature extraction by showing an accuracy of 30%, while TF-IDF is 62%.

Index Terms—Emotion Recognition Text, Lexicon, InSet Lexicon, Feature Extraction, Random Forest

I. INTRODUCTION

Communication between individuals is generally done verbally and non-verbally. Verbal communication begins and is obtained through words, sentences, or paragraphs. We often do not catch the emotion implied in the written words, sentences, and sections in verbal communication. As time goes by, the way of communication between individuals has changed. When technology is developing, the exchange of information flows spreads and develops rapidly. Social media is an oral communication tool that is often accessed and has become a trend. In 2021, Indonesia will have active social media users, as much as 61.8% of the existing population[1]. The number increased by 6.3% from the last year. Not only as a trend, but social media has also become a necessity. It can be seen from the statistical data of the social media users that it continuously grows every year. Various video, voice, and text data are added every minute. The flow of data information carried by social media is enormous. Thus, it is necessary to have an accurate processing model so that the information on social media can be processed correctly. Social media has become a part of life in modern society. Through social media, people often

express themselves regarding existing changes. Not only do they give objective opinions on an event, but social media users also often express their subjective views. Social media is considered a critical communication medium [2]. Not only opinions or criticisms about an event, but social media users also often criticize products, services, and even government decisions currently hotly discussed. Social media can be used as a medium for monitoring public opinion. This social media user shares their emotions in posts that many people from various platforms watch. Emotion influences humans to express hundreds of words. Therefore, it is considered a crucial thing in communication.

Natural Language Processing (NLP) in computational linguistics is a modern study of linguistics using computer science tools. NLP is also known as a subfield of Artificial Intelligence (AI). [3] NLP extract meaningful information from various texts, including text from social media. Social media has big data containing essential informations. These data give valuable information about a particular phenomenon, government policies, or reviews of using specific products. [4] NLP allows researchers to easily extract beneficial insights in textual datasets while avoiding burdensome computational work. These responses, comments, and reviews are then assessed based on sentiment class, commonly known as sentiment analysis.

Starting from the field of sentiment analysis, which analyzes opinions or messages into negative, positive, and neutral sentiment, emotion recognition is a sub-field of more detailed sentiment analysis that recognizes happy, sad, and angry emotions. Emotional interaction has been a part of a psychological phenomenon in daily life. It can be easily found in everyday interaction and encourages the existence of emotion recognition. Emotion recognition becomes the basis of successful human interaction, communication, and decision-making. The development of big data influences it to become a significant issue both academically and industrially. [5] Text data produced in emotional communication is often used to understand the human's emotional state. A person's emotional state is often associated with

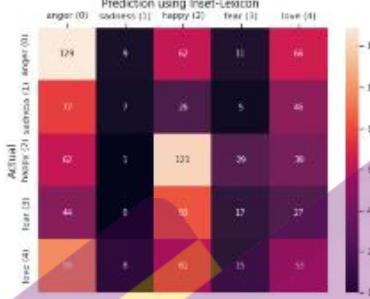

Fig. 7. Confusion Matrix of InSet Lexicon using Random Forest

The emotion class "Sadness" has a small proportion of false-positive values with moderate false negatives, which causes the "Sadness" class to have a small recall value even though it reaches a high precision value. Fig. 8 shows the TF-IDF feature extraction confusion matrix in the Random Forest classifier.

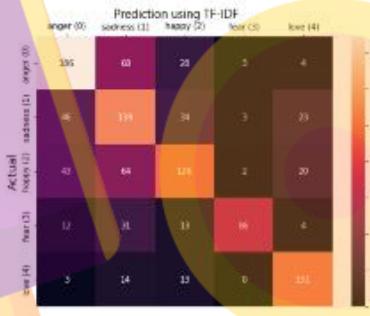

Fig. 8. Confusion Matrix of TF-IDF using Random Forest

Feature Extraction with TF-IDF provides better accuracy results on InSet Lexicon. Each emotion class can be predicted with a high F1-Score. The same with the Random Forest classification in InSet Lexicon feature extraction, the emotion class "Sadness", with a 49% score, has the lowest F1-Score value among other emotion classes.

V. CONCLUSION

This study examines the Lexicon based feature extraction on the emotion recognition dataset of Indonesian texts in the form of a corpus or dictionary called InSet Lexicon. The results of this study show an accuracy of 30%. The accuracy of this result is higher than the previous study that had the same dataset and classification. The difference in accuracy is influenced by the pre-processing stages carried out

in both studies. However, it has less accuracy than feature extraction using TF-IDF which has an accuracy of 62% on the Random Forest classifier. In this study, each emotion class (Anger, Sadness, Happy, Fear, and Love) can be detected with the used classifier. The low accuracy value in the InSet lexicon is caused by the polarity value that is not influenced by the emotion labels in the dataset. Lexicon feature extraction using the Lexicon InSet, which usually provides high accuracy when used to analyze Indonesian sentiment, produces low accuracy in the emotion recognition dataset of Indonesian texts.

We will examine and improve the current results for further research to achieve better performance. The researcher also suggests future studies to investigate the effect of class imbalance on the dataset for each text weighting scheme. The imbalance plays a significant role in creating a presupposition toward selecting the majority class in the emotion recognition dataset of Indonesian texts.
